

HIRING ASSIGNMENT

AI Ops Engineer

Time limit: 5 hours

Report your actual start and end time. We respect honesty.

The Setup

You are the first AI Ops Engineer at QuickMove, a company that helps people relocate to a new city.

QuickMove coordinates the entire relocation experience for its customers:

- Finding and shortlisting rental apartments (through property partners across 8 cities)
- Booking packers and movers (through logistics partners in each city)
- Setting up utilities at the new address (electricity, internet, gas, water)
- Managing address change paperwork (bank accounts, ID documents, subscriptions)
- Post-move support (local services orientation, issue resolution)

The scale: 200+ relocations per month, growing 20% quarter over quarter.

The complexity: Every city has different property partners, different moving vendors, different utility providers, different documentation requirements, and different timelines. A relocation to Bengaluru looks completely different from one to Pune.

Your team: You have 5 ops people who handle on-ground coordination. They are execution-focused and reliable, but they work entirely through WhatsApp groups, shared Google Sheets, and email. There is no engineering team available.

The Assignment

You have 5 hours. At the end, you will submit three things.

Submission 1

The Map

Map the entire QuickMove operation as a system. Every workflow, every stakeholder, every handoff, every dependency.

Then answer:

- Where are the highest-leverage automation opportunities? Rank your top 3 and explain *why* in that order.
- What metrics would you define to measure the health of each workflow?
- What are the edge cases and failure modes that most people would miss?

This is the part where depth matters most. Anyone can list 5 workflows. We want to see if you can find 15. Anyone can spot the obvious bottleneck. We want to see if you can find the ones hiding underneath.

Submission 2

The Build

Pick ONE workflow from your map, the one you believe has the highest impact, and build a working solution using AI tools.

Not a flowchart. Not a slide deck. Not a mockup. A working tool, system, or automation that an ops team could actually start using tomorrow.

Use any AI tool you want: Claude Code, Cursor, ChatGPT, Codex, Replit, or anything else. The choice of tools is part of the evaluation.

We will evaluate:

- Does it actually work?
- Does it solve a real problem or just look like it does?
- How thoughtful is the design? (Edge case handling, error states, usability)
- Would a non-technical ops person be able to use this?
- Does it have taste? (Clean, considered, not just functional)

Submission 3

The Build Log

Share your complete prompt history, build log, and the responses generated by the AI tools you used. Every prompt you wrote, every response you received, every iteration, every dead end, every pivot.

We want to see the full conversation between you and the AI. Not just what you asked, but what the AI gave you, how you evaluated those responses, what you accepted, what you pushed back on, and how you redirected when something was not right.

We are evaluating:

- How do you decompose a problem before you start building?
- How do you iterate when something does not work?
- How do you make decisions about what to build and what to skip?
- How effectively do you direct AI tools to get the output you want?
- How do you evaluate and respond to what the AI generates?

How to capture this: Export your entire chat/prompt history from whatever AI tool(s) you used, including the AI responses. Screenshots, exported chats, or a document with your prompts and the complete outputs. Do not clean it up. We want to see the real process, including the messy parts.

Rules

1. **Time limit: 5 hours.** Report your actual start and end time.
2. **Use AI tools.** This is not a test of whether you can code from scratch. It is a test of whether you can think deeply and use AI tools to build real solutions.
3. **Work alone.** The prompts should be yours. The thinking should be yours.
4. **No specific format required for Submission 1.** Document, spreadsheet, Notion page, hand-drawn diagram that you photograph, whatever communicates your thinking most clearly.
5. **Submission 2 must be a working solution.** A deployed link, a downloadable tool, a working spreadsheet with automations, a functioning bot. Something we can test.
6. **Submission 3 must include both your prompts AND the AI responses.** Incomplete logs with only your prompts will not be accepted.

Submission

Email your three submissions (The Map, The Build, The Build Log) to mehvish@stampmyvisa.com with the subject line:
